

I connected the customer to the ticket in a one to one or many relationship, because each customer needs to have at least one ticket to see a movie, but could have more than one tickets to see multiple movies.

I connected the ticket to movie in a one or many to one relationship because each ticket is good for one movie, but multiple customers may have tickets to see the same movie.

I connected the customer to concessions in a manner that there could be none or many customers that buy concessions, and they could buy none or many concessions for that movie
